Hand-written Schema

bookingid → UUID/GUID

booking →

firstname → string

lastname → string

totalprice → double

depositpaid → boolean

bookingdates →

checkin → date

checkout → date

additionalneeds → string

Claude Response

Field name	JSON data type
bookingid	number
booking	object
booking.firstname	string
booking.lastname	string
booking.totalprice	number
booking.depositpaid	boolean
booking.bookingdates	object
booking.bookingdates.checkin	string
booking.bookingdates.checkout	string
booking.additionalneeds	string

Comparison / Differences

My handwritten schema had several mistakes and uncertainties when compared with Claude's response:

- **bookingid:** I initially identified it as a UUID/GUID, but Claude correctly identified it as a **number**.
- **booking:** I was unsure about its type, while Claude correctly identified it as an **object**.
- **totalprice:** I wrote **double**, while Claude identified it as **number**. JSON uses the general number type rather than separate double and float types.
- **bookingdates:** I was unsure about its type, while Claude correctly identified it as an **object**.
- **checkin and checkout:** I identified them as **date**, but Claude correctly identified them as **string** because JSON has no native date data type.
- **firstname, lastname, depositpaid, and additionalneeds:** My types matched Claude's response.

Overall, Claude correctly identified all the JSON data types in the response. The main mistakes in my handwritten schema were confusing the numeric bookingid with a UUID/GUID, using date for date values, and using double instead of JSON's number type.

Dynamic Variables and AI Test Scripts

I used Postman's environment variables to chain the requests: the authentication request saved the token, while the Create Booking request saved the generated bookingid, which was then used by the Get Booking request through {{bookingid}}. The Claude-generated Postman test scripts worked successfully without requiring any changes, and all assertions passed during testing.
